

Hi let me introduce our asset
 Our asset is a traditional Korean culture-based humanoid bonnet setting character.
 Male characters only consist of humanoid bones,
 and female characters make up skirt movements with generic bonnets in addition to humanoid bones.
 For usability verification and ease of use, we created loop animation, Idle Walk Run Jump, and more.
 It is connected one by one to the animation controller, and each animation is loop animation,
 so you can connect only the animation you need to one and use it right away for the project.
 Also, if you want to modify the animation, it can be edited in other DCC tools. For your convenience,
 we have created a PDF, so please keep that in mind and pay attention to the use.
 Our work is free from secondary creative copyrights. Thank you

For female characters, animation is included in the generic version.
 If you use animation in a generic state, you can use it smoothly. Thank you

How to use animation

By default, using prefab files, you LOOP the whole animation once.
 But to really use it properly, you need to go into the animation controller folder,
 select the animation you want in the AC file, and control the rest of the connection.
 And the selected animation has to go into the animation resource folder separately and set the loop time
